

# Methodology: Marquette Law School Poll, U.S. Supreme Court and National Issues Survey

March 13-22, 2023

Charles Franklin

3/28/23

## Survey description

The Marquette Law School Poll national survey of public views of the U.S. Supreme Court and national issues was conducted March 13-22, 2023. A total of 1004 adults were interviewed by SSRS of Glen Mills PA, using the SSRS Opinion Panel, a representative probability-based panel of adults ages 18 and over living in the United States, recruited using the SSRS Omnibus poll and through address-based sampling (ABS). The margin of error is +/-3.8 percentage points for the full sample. There are 863 registered voters, with a margin of error of +/-4.0 percentage points. Among registered voters, the Republican subsample has a sample size of 381 with a margin of error of +/-6.1 percentage points. There are 401 Democrats, with a margin of error of +/-5.9 percentage points.

The survey is a general population sample of U.S. adults age 18 and over living in the 50 states.

As described below SSRS Opinion Panel members are recruited randomly based on nationally representative ABS (Address Based Sample) design (including Hawaii and Alaska). ABS respondents are randomly sampled by Marketing Systems Group (MSG) through the U.S. Postal Service's Computerized Delivery Sequence (CDS), a regularly-updated listing of all known addresses in the U.S. For the SSRS Opinion Panel, known business addresses are excluded from the sample frame.

Additionally, the SSRS Opinion Panel recruit hard-to-reach demographic groups via the SSRS Omnibus survey platform. The SSRS Omnibus survey is a nationally representative (including Hawaii and Alaska) bilingual telephone survey.

## AAPOR Transparency Initiative Information

The Marquette Law School Poll Supreme Court Survey follows the guidelines for disclosure of the American Association for Public Opinion Research Transparency Initiative. For more information on the initiative see: [AAPOR Transparency](#)

1. The poll is sponsored by Marquette Law School.

2. The Marquette Law School Poll, under the direction of Prof. Charles Franklin, designed the survey instrument and performed all statistical analysis. The data collection was administered by SSRS of Glen Mills PA, using the SSRS Opinion Panel, a representative probability-based panel of adults ages 18 and over living in the United States.
3. Funding for this study was provided by the Marquette Law School Alumni Annual Fund. Their support is gratefully acknowledged.
4. The full survey instrument for this study is available online at [Survey Instrument](#)
5. The population surveyed consists of the general population of U.S. adults age 18 and over living in the 50 states.
6. The sample frame is a nationally representative ABS (Address Based Sample) design (including Hawaii and Alaska). ABS respondents are randomly sampled by MSG through the U.S. Postal Service's Computerized Delivery Sequence (CDS), a regularly-updated listing of all known addresses in the U.S.. Additionally, the SSRS Opinion Panel recruits hard-to-reach demographic groups via the SSRS Omnibus survey platform. The SSRS Omnibus survey is a nationally representative (including Hawaii and Alaska) bilingual telephone survey.
7. The sample uses the SSRS Opinion Panel and is based on address and telephone samples supplied by Marketing Systems Group (MSG). Details of design and response rate are given below.
8. The sample was designed to be representative of the adult population of the United States. The sample size is 1004. The margin of error, including design effects due to post-stratification is +/-3.8 percentage points for the full sample. There are 863 registered voters, with a margin of error of +/-4.0 percentage points. Among registered voters, the Republican subsample has a sample size of 381 with a margin of error of +/-6.1 percentage points. There are 401 Democrats, with a margin of error of +/-5.9 percentage points.
9. The design effect for this survey is 1.52 which has been incorporated in the calculation of all reported margins of error.
10. The survey was administered in English only and was administered on the web. The data were collected March 13-22, 2023.
11. Results for all items in the survey, including the full instrument, topline results, crosstabs and this methodological report are be available online at [link](#)
12. For further information contact the survey director, Prof. Charles Franklin at [Charles.franklin@marquette.edu](mailto:Charles.franklin@marquette.edu)
13. Further methodological details are included in the attached report from SSRS.

## Overview

Marquette University Law School (MULaw) engaged SSRS to conduct the March Court Survey via the SSRS Opinion Panel among U.S. adults age 18 and older. Data collection was conducted from March 13 to 23, 2023 among a sample of 1,004 respondents.

The survey was conducted via web in English. Data were weighted to represent the target population of U.S. adults ages 18 or older. The margin of sampling error for the complete set of weighted data is  $\pm 3.8$  percentage points.

This report provides information about the sampling procedures and the methods used to collect, process, and weight data for this study.

## Sample Design: SSRS Opinion Panel

SSRS Opinion Panel members are recruited randomly based on nationally representative ABS (Address Based Sample) design (including Hawaii and Alaska). ABS respondents are randomly sampled by Marketing Systems Group (MSG) through the U.S. Postal Service's Computerized Delivery Sequence File (CDS), a regularly-updated listing of all known addresses in the U.S. For the SSRS Opinion Panel, known business addresses are excluded from the sample frame.

The SSRS Opinion Panel is a multi-mode panel. Internet households participate via web while all non-internet households (including those who have internet but are unwilling to take surveys online) participate via phone.

## Survey Sampling

All sample drawn for this study were SSRS Opinion Panelists who are U.S. adults ages 18 or older. Sample drawn was stratified by age, gender, race and ethnicity, education, Census region, party identification, and preferred survey language to ensure adequate representation of each demographic group.

## Questionnaire Design

The questionnaire was developed by MULaw in consultation with the SSRS project team. SSRS reviewed the questionnaire primarily to identify potential problems in the instrument that might increase respondent burden, cause respondents to refuse or terminate the survey, create problems with respondent comprehension, or pose practical challenges for mode-specific administration such as complex skip patterns.

## Data Collection

### Web Contact Procedures

The administration schedule was as follows:

**Table 1: Study Schedule:**

Touchpoint	Start	End
Soft launch	03/13/2023	03/14/2023
Full launch	03/14/2023	03/23/2023

A “soft launch” inviting a limited number of panelists to participate was conducted on March 13 to 14, 2023. After checking soft launch data to ensure that all questionnaire content and skip patterns were correct, additional sample was released to ensure the final sample met the study goals.

Web panelists were emailed an invitation to complete the survey online. The email for each respondent included a unique password-embedded link. All panelists who did not respond to the email invitation received up to two reminder emails, and panelists who had opted into receiving text messages from the SSRS Opinion Panel received one text message reminder.

In appreciation for their participation, panelists received post-paid compensation in the form of an electronic gift card, sent via email immediately after completion of the survey.

Median web survey length was approximately 11 minutes.

## Programming, Data Processing, and Integration

### Programming

Prior to the field period, SSRS programmed the study into its Forsta Plus (formerly known as Confirmit) Web/CATI platform for administration in English. Extensive checking of the program was conducted to ensure that skip patterns and sample splits followed the design of the questionnaire.

Additional steps were employed to ensure a quality experience in survey administration regardless of the device utilized by respondents, whether a desktop computer, tablet, or phone. The web program was optimized for administration via smartphone or other mobile handheld devices. The web program was also checked on multiple devices, including desktop computers and handheld mobile devices, and different web browsers to ensure consistent and optimized visualization across devices and web browsers. The web survey was accessed directly by respondents, using their unique survey links with embedded passwords. This also gave them the ability to return to their survey later if they chose to suspend their survey.

## Quality Control Checks

For web surveys, quality checks were incorporated into the survey. For the March Court Survey, Respondents who finished the survey in less than 3 minutes (~30% of survey length) were not included in the final data set.

A total of n=3 completed surveys were removed after applying these cleaning standards (0.3%).

## Weighting and Design Effects

Data were weighted to represent the residential adult population of the United States. The data were weighted by applying a base weight and balancing the demographic profile of the sample to target population parameters.

### Base Weight (BW)

The base weight for the SSRS Prob Panel was computed differently depending on whether the panelist was recruited from the SSRS RDD telephone Omnibus or from address-based sample (ABS).

### Telephone Omnibus Recruits

The base weight for the telephone omnibus recruits is their original base weight computed at the time of the original omnibus interview. This base weight accounts for selection probabilities associated with the overlapping dual-frame Omnibus sample design.<sup>1</sup> This base weight is a function of the landline and cell frame and sample sizes as well as each respondent's telephone usage and number of adults in the household.

### ABS Recruits

The base weight for ABS recruits is the product of a sampling weight and a household size adjustment. The sampling weight corrects for the disproportionate ABS design by adjusting the distribution of sample across the ABS strata to match the distribution of the ABS frame across strata.

ABS recruits come from a variety of sample sources, some of which employ different stratification schemes. ABS base weights are computed based on one of two stratifications. One stratification is geo-demographic. The unit of the stratification is Census Block Group and the strata are based on region, incidence of African American residents and incidence of Hispanic residents. The second stratification includes substrata based on modeled party identification.

After applying the base weight for the ABS recruits, a household size adjustment corrects for the sampling of one adult in each sampled household.

<sup>1</sup> Buskirk T.D., Best J. (2012) Venn Diagrams, Probability 101 and Sampling Weights Computed for Dual Frame Telephone RDD Designs. *Journal of Statistics and Mathematics*. Vol. 15: 3696-3710.

### Non-Internet Adjustment

For projects that collect data entirely online, people who do not use the Internet are necessarily not included in the sample. To account for this non-coverage and make the results more representative of the entire target population, we make a non-internet adjustment to the base weight.

This is a propensity score adjustment that models adults with internet access to be representative of all adults (regardless of whether or not they have internet access). Propensity scores are estimated by modeling panel response mode on a range of demographic, attitudinal and behavioral covariates. The model is a CART2 (Classification and Regression Trees) decision tree built in SPSS by using its scoring wizard available with the decision tree license.

### Raking

With the base weight applied, the data were weighted to balance the demographic profile of the sample to the target population parameters.

Missing data in the raking variables were imputed using hot decking. Hot deck imputation replaces the missing values of a respondent randomly with another similar respondent without missing data. Hot decking was done using an SPSS macro detailed in 'Goodbye, Listwise Deletion: Presenting Hot Deck Imputation as an Easy and Effective Tool for Handling Missing Data' (Myers, 2011).

Weighting was accomplished using SPSSINC RAKE, an SPSS extension module that simultaneously balances the distributions of all variables using the GENLOG procedure.<sup>3</sup>

Data were weighted to distributions of: sex by age, sex by education, age by education, detailed education, race/ethnicity, census region, civic engagement, population density, party ID<sup>4</sup>, voter registration, religious affiliation, and internet use frequency. The following table shows the data sources used for calibration totals.

	Not Affiliated	31.4%	32.5%	31.0%
Internet Frequency	Almost constantly	44.2%	48.8%	44.7%
	Several times a day	44.4%	44.8%	44.8%
	About once a day	5.3%	4.5%	5.4%
	Several times a week	3.7%	1.2%	3.1%
	Less often	2.3%	0.7%	2.1%

### Effects of Sample Design on Statistical Inference

Post-data collection statistical adjustments require analysis procedures that reflect departures from simple random sampling. SSRS calculates the effects of these design features so that an appropriate adjustment can be incorporated into tests of statistical significance when using these data. The so-called "design effect" or *deff* represents the loss in statistical efficiency that results from a disproportionate sample design and systematic non-response. The total sample design effect for this survey is 1.52.

SSRS calculates the composite design effect for a sample of size  $n$ , with each case having a weight,  $w$ , as:<sup>11</sup>

$$deff = \frac{n \sum w^2}{(\sum w)^2}$$

The survey's margin of error is the largest 95% confidence interval for any estimated proportion based on the total sample — the one around 50%. For example, the margin of

<sup>11</sup> Kish, L. (1992). Weighting for Unequal Pi. Journal of Official Statistics, Vol. 8, No.2, 1992, pp. 183-200.

error for the entire sample is  $\pm 3.8$  percentage points. This means that in 95 out of every 100 samples drawn using the same methodology, estimated proportions based on the entire sample will be no more than 3.8 percentage points away from their true values in the population. Margins of error for subgroups will be larger. It is important to remember that sampling fluctuations are only one possible source of error in a survey estimate. Other sources, such as respondent selection bias, questionnaire wording, and reporting inaccuracy, may contribute additional error of greater or lesser magnitude.

### Sample Disposition and Response Rate

Table 4 details the completion and response rates for this study.

**Table 4: Completion Rate/Response Rate:**

Completion Rates/Composite Response Rates	Total
Total Sample (Invited to participate)	3188
Screen-outs	5
Total Eligible	3180
Quality control removals	3
Incompletes	118
Quota full	0
Completions*	1004
Incidence/Eligibility rate	99.2%
Survey Completion rate (Completions/Total invited to participate)	31.5%
Survey RR3	31.7%

*\*Excludes screen-outs or data quality removals that completed the survey.*

### Cumulative Response Rate

Cumulative response rate that takes into consideration the response rate for the panel recruitment survey, percent of recruitment survey respondents that agree to join the panel and the panel survey specific RR3 reported above comes to 2.0%.

### Deliverables

Final deliverables for this study were as follows:

- Weighted SPSS dataset
- Methodology report
